Reproductive morbidity is a health problem related to reproductive organs and functions of the whole reproductive system which may or may not necessarily, be a consequence of reproduction. It is a major health problem that seriously affects women's life. It can be categorized into three major sub-groups such as gynaecological, obstetric, and contraceptive morbidity.

The present study mainly focussed on the prevalence of self-reported gynaecological and obstetric morbidity among the rural Kaibarta women of Assam. An attempt was also made to understand the treatment seeking behaviour regarding reproductive health problems as per their educational status
